

V-Tracker v2.0

Virtual World Metrics Capture and Analysis Platform

Graphs on large screen are actual V-Tracker graphic reports.

Gauging the measures of success and return on investment that go into the creation of immersive environments for Virtual Worlds.

V-Tracker is a suite of tools used to capture visitor data while providing easy to use web-based analytics. It allows the analyst to create their own visit scanners,

touch event sensors and public channel chat loggers, and then group them under a single campaign. Multiple campaigns can be configured for tracking specialized data. This ease and flexibility finally allows proper A-B testing scenarios to be conducted within the Second Life® platform.

No longer must you guess when trying to determine who's coming to your space, what they are doing, and when were they doing it. Powerful graphics based reporting allow you to quickly focus on areas of interest and gain immediate understanding into what's really going on at your site.

V-Tracker was created by Code4Software, a company always at the forefront of software development technologies. When you have mission critical projects that need to be done right the first time, Code4Software will perform by applying over 20 years of software development experience. We are Enterprise level experts, having successfully performed projects for many Fortune 500 companies.
